

Bilal Drive Man

Operations Manual

For the person managing day-to-day downloads

Last updated 2026-05-04 · bilal-drive-man.vercel.app · [GitHub](#)

Open the portal in another tab and follow along step-by-step.

URL: <https://bilal-drive-man.vercel.app>

(Login with the credentials Zain shared. Once logged in, take 5 minutes and walk through the 6 sections below.)

Section 1 — The sidebar (left rail)

After login you land on the **Dashboard**. The dark left-rail sidebar shows 6 icons:

- Dashboard ← drive overview, summary stats
- Drives ← every external + cloud drive the system has ever seen
- Devices ← computers running the scanner (e.g. DOWNLOADING-PRO)
- Downloading-Pro ← THIS IS WHERE YOU'LL LIVE 90% OF THE TIME
- Search ← find a couple by name
- History ← past sync events + activity log

The yellow-highlighted item is "Downloading-Pro" — that's the one for managing actual download orders. **Click it.**

Section 2 — Downloading-Pro page (your daily driver)

You'll see **5 stat cards** at the top:

Card	What it counts
Total	Every project in the system
Not Downloaded	Waiting — these are jobs you can fire
Active	Currently in flight (downloading, copying, queued, paused)
Downloaded	Completed — files are on the external drive
Failed	Needs attention — click to investigate

Click any card — the project list below filters to just that bucket. Click again (or click "Total") to clear the filter.

Below the cards is a **green "Sync from Notion" button**. Click it whenever you want to pull the latest project data from Notion. Auto-syncs every 5 min anyway, but click it for instant freshness.

Below that is the **project table**. Each row has:

- **Project** — the couple/event name (click the  arrow on the left to expand)
- **Client** — photographer / company who owns this project
- **Date** — wedding/event date
- **Status** — colored badge showing current state
- **Queue** — position in the download queue (only filled when status = Queued)
- **Actions** — buttons that appear depending on status (Download, Pause, Cancel, Resume, Retry)

Status badges and what they mean

Badge color	Meaning	What action is available
Not Downloaded (amber)	Waiting to be fired	Click to expand → click Download button
Queued (yellow)	Waiting its turn behind another active download	Auto-starts when current job finishes
Downloading (blue)	Pulling files from cloud	Pause / Cancel buttons available
Copying to (purple)	Downloaded, copying to external drive now	(in flight, just wait)

Badge color	Meaning	What action is available
Copied to (green)	DONE — files are on the drive	(no action — complete)
Paused (gray)	User-paused mid-download	Click Resume to continue
Failed (red)	Error — read the message	Click Resume (auto-retry) or expand for details

Section 3 — Firing a download (most common task)

1. Find the project in the **Not Downloaded** list (or click the Not Downloaded stat card to filter).
2. Click the  **arrow** on the left of the row → row expands and shows a **Download** button.
3. Click **Download**. A 2-step wizard pops up:

Step 1 — Confirm the link Wizard pre-fills the download link (Dropbox / GDrive / WeTransfer URL from Notion). If it's wrong, edit and click Next.

Step 2 — Pick where it goes

- **Machine:** dropdown — select **DOWNLOADING-PRO** (always, unless told otherwise)
- **Target Drive:** dropdown — pick the external drive currently plugged in (Florida2, Hawaii 4tb, etc.). The dropdown only shows currently-connected drives.
- **Cloud Account:** usually leave on "Auto (PC default)" — ignore this unless Zain told you otherwise.

4. Click **Start Download**.
5. Modal closes. Project's badge flips to **Queued** or **Downloading**.

You're done — system handles the rest. Files will land on the external drive at :\\ automatically.

Realistic timing: 1 GB takes ~2-3 min on a normal connection. 10 GB ~20 min. 100 GB ~3-4 hours. Watch the progress bar (visible when the row is expanded).

Section 4 — When something goes wrong

A red **Failed** badge means something broke. Click the row to expand — the error message appears in red right under the project title.

Top 3 errors you'll see and exactly what to do:

Error: "Cloud folder ... no longer present in Dropbox"

The shared folder vanished from Dropbox. Either the original sender deleted it, unshared it, or Dropbox glitched. **Fix:**

1. Email or Slack the original sender, ask them to re-share the folder
2. Once re-shared, click **Resume** (or re-fire from the wizard). It'll work this time.

Error: "Target drive not found: "

The external drive isn't plugged into DOWNLOADING-PRO right now. **Fix:**

1. Check DOWNLOADING-PRO physically — is the drive plugged in?
2. Wait ~30 seconds for the scanner to detect it
3. Refresh the dashboard, click **Resume**

Error: "getaddrinfo failed" / "network" / "connection timeout"

DOWNLOADING-PRO's internet was down during the download. **Fix:**

1. Check the **Devices** tab — is DOWNLOADING-PRO's "Last seen" recent (within last 60s)? If not, scanner is offline; investigate the PC.
2. If scanner is online, just click **Resume** — already-synced files skip; only the missing ones download.

For ANY error message that doesn't match the patterns in `HANDOVER_OPS.md` — copy the exact text and email Zain.

Section 5 — Drives page (NEW: Ignore Permanently)

Click **Drives** in the sidebar. You'll see two sections:

Connected (3)	← drives currently plugged in somewhere	
■ Florida2 2	2.10 TB used / 1.82 TB · 95% · 25C / 68Cp · Connected (D:)	[Ignore Perma
■ Hawaii 4tb	...	[Ignore Perma
■ Newyork 4tb	...	[Ignore Perma
Disconnected (16)	← drives not plugged in but still tracked	
■ Cali 4tb	...	[Ignore Perma
■ ... (etc)		

The **"Ignore Permanently" button** (right side of each row) is new as of 2026-05-04. Use it when:

- A weird drive shows up that isn't a real wedding-photo drive (camera SD cards, software installer DMGs, virtual mounts, etc.)
- You see something like EOS_DIGITAL, Codex Installer, 19045-6456_x64_MUI, or a Windows ISO mount

Click → confirm dialog → drive disappears forever from the dashboard. (The scanner still detects it physically — only the display is hidden.)

To un-ignore: there's no UI for this yet. Email Zain — it's a one-line database flip.

Section 6 — Devices page (scanner health)

Click **Devices** in the sidebar. You'll see one row per machine running a scanner:

DOWNLOADING-PRO • Last seen: 2 min ago • download PC • 0 active downloads

What to check daily:

- **Last seen** — should always be within the last 60 seconds. If it's older than 5 minutes, the scanner on DOWNLOADING-PRO is stuck or offline.
- If stuck: go to DOWNLOADING-PRO, open PowerShell (right-click Start menu → "Windows PowerShell"), and run:

```powershell Start-ScheduledTask -TaskName "BilalDriveManScanner" ``` Wait 30 seconds, refresh the Devices page. "Last seen" should update.

## Section 7 — Common scenarios cheat sheet

Situation	What to do
New project from photographer just dropped in Notion	Click <b>Sync from Notion</b> in Downloading-Pro page → wait 30s → it appears in Not Downloaded list → fire as normal
Two projects need to download to same drive	Fire both — second one auto-queues. No action needed.
Drive ran out of space mid-copy	Project flips to Failed with disk-full message. Plug in a fresh drive, click Resume.

Situation	What to do
Photographer asks "is X downloaded yet?"	Search bar at top (or click Search icon). Type couple name. Status badge shows current state.
Heartbeat shows "stale 5h ago" but scanner.log on PC is heartbeating fine	Network blip on the PC's side. Wait 5 min and re-check before doing anything.
Multiple BilalDriveMan-Scanner.exe processes running on DOWNLOADING-PRO	Old artifact — should never happen with the auto-restart Task Scheduler config. If you see it, open Task Manager, kill the older PIDs (smaller PID = older), Task Scheduler will keep one alive.

---

## Final notes

- **Do NOT delete** any project from the portal directly — they're synced from Notion. Delete in Notion if needed; portal will follow on next sync.
- **Do NOT change** scanner config files on DOWNLOADING-PRO unless Zain instructs you. The system is set up to self-heal.
- **DO read** HANDOVER\_OPS.md (the printable PDF version HANDOVER\_OPS.pdf) — it has the same info plus deeper escalation patterns.
- When in doubt: click **Sync from Notion**, then wait 30s and look again. 80% of "weird states" resolve themselves on next sync.

---

**Reach out to Zain at [zainansari0340@gmail.com](mailto:zainansari0340@gmail.com) for anything that doesn't match a pattern above.** No question is too small.
